Instruction Manual // MS series

Scientific calculator

Please read carefully before use and safe keeping, for inspection

Before getting started...

Modes

Before starting a calculation, you must first enter the correct mode as indicated in the table below.

To perform this type of calculation:	Perform this key operation:	
Basic arithmetic calculations	MOS 1	COMP
Standard deviation	NC06 2	SD
Regression calculations	MODE 3	REG

- · Pressing the week key more than once displays additional setup screens. Setup screens are described in the sec tions of this manual where they are actually used to change the calculator setup.
- In this manual, the name of the mode you need to enter in order to perform the calculations being described is indicated in the main title of each section

Example:	-
Example.	1

Sta	itis	tic	al	
Ca	lcu	lat	io	ns

REG

Note!

To return the calculation mode and setup to the initial defaults shown below, press (LS 2 (Mode))

Calculation Mode:	COMP
Angle Unit:	Deg
*Exponential Display Format:	Norm 1
Fraction Display Format:	ab/c
Decimal Point Character:	Dot

 Mode indicators appear in the upper part of the display
 Be sure to check the current calculation mode (SD, REG. COMP) and angle unit setting (Deg, Rad, Gra) before beginning a calculation.

■ Multi-statements

A multi-statement is an expression that is made up of two or more smaller expressions, which are joined using a colon

Example: To add 2+3 and then multiply the result by 4*

Exponential Display Formats

This calculator can display up to 10 digits. Larger values are automatically displayed using exponential notation. In the case of decimal values, you can select between two formats that determine at what point exponential notation is used

To change the exponential display format, press the 🖾 key a number of times until you reach the exponential display format setup screen shown below

 Press 3. On the format selection screen that appears, press 1 to select Norm 1 or 2 for Norm 2

Norm 1

With Norm 1, exponential notation is automatically used for integer values with more than 10 digits and decimal values with more than two decimal places.

With Norm 2, exponential notation is automatically used for integer values with more than 10 digits and decimal values with more than nine decimal places

· All of the examples in this manual show calculation results using the Norm 1 tormat.

Decimal Point and Separator Symbols

You can use the display setup (Disp) screen to specify the symbols you want for the decimal point and 3-digit sepa-

 To change the decimal point and separator symbol set-ting, press the week key a number of times until you reach the setup screen shown below.

- Display the selection screen.
- Press the number key (1 or 2) that corresponds to the setting you want to use.
- 1 (Dot): Period decimal point, comma separator 2 (Comma): Comma decimal point, period separator

Initializing the Calculator

 Perform the following key operation when you want to initialize the calculation mode and setup, and clear replay memory and variables.

Basic Calculations COMP

Arithmetic Calculations

Use the we key to enter the COMP Mode when you want to perform basic calculations. COMP

- Negative values inside of calculations must be enclosed within parentheses. For details, see "Order of Operations
- It is not necessary to enclose a negative exponent within parentheses.

sin 2.34 × 10⁻⁵ → sin 2.34 EXP (--) 5

• Example 1: $3\times(5\times10^{-9}) = 1.5\times10^{-8}$

3 X 5 EXP (-) 9

- 5 🔀 🕻 9 🖶 7 🖸 🚍 Example 2: 5×(9+7) = 80
- You can skip all operations before

■ Fraction Operations

Fraction Calculations

- · Values are displayed in decimal format automatically whenever the total number of digits of a fractional value (integer+numerator+denominator+separator marks)
- 2 4 3 1 1 4 5 13, 15. • Example 2: $3\frac{1}{4} + 1\frac{2}{3} = 4\frac{11}{12}$

1 4 2 4 3 • Example 3: $\frac{2}{4} = \frac{1}{2}$

2 4

4_ 11_12.

• Example 4: 1/2 +1.6 = 2.1

1 4 2 1 1.6

 Results of calculations that mix fraction and decimal values are always decimal

Decimal ← Fraction Conversion

- Use the operation shown below to convert calculation results between decimal values and fraction values.
- Note that conversion can take as long as two seconds

 Example 1: 2.75 = 2 ³/₄ (Decimal → Fraction) 2.75 2.75 2,3,4 11_4.

↔ 0.5 (Fraction ↔ Decimal)

1 4 2 1_2. 0.5 ak 1_2

- Mixed Fraction ↔ Improper Fraction Conversion
- Example: 1 2/3 1 ak 2 ak 3 1_2_3. SHIFT d/c 5...3.
- You can use the display setup (Disp) screen to specity the display format when a fraction calculation result is
- greater than one.

 To change the fraction display format, press the key a number of times until you reach the setup screen shown

Disp

- Display the selection screen.
- Press the number key (1 or 2) that corresponds to the setting you want to use.

1 (ab/c): Mixed fraction 2 (d/c): Improper fraction

 An error occurs if you try to input a mixed fraction while the d/c display format is selected.

■ Degrees, Minutes, Seconds Calculations

- You can perform sexagesimal calculations using degrees (hours), minutes, and seconds, and convert between sexagesimal and decimal values
- Example 1: To convert the decimal value 2.258 to a sexagesimal value and then back to a decimal value

2.258 SHIFT 2º15º28.8 2.258

• Example 2: To perform the following calculation: 12°34'56" × 3.45

12 - 34 - 56 - 3.45 43°24°31.2

FIX, SCI, RND

· To change the settings for the number of decimal places, the unmber of significant digits, or the exponential dis-play format, press the exponential dis-play format, press the less than a number of times until you reach the setup screen shown below.

- Press the number key (1, 2, or 3) that corresponds to the setup item you want to change.
- Number of decimal places 2 (Sci): Number of significant digits 3 (Norm): Exponential display format
- Example 1: 200 ÷ 7 × 14 :

The following performs the same calculation using the specified number of decimal places.

200 🖾 7 🗐 28.571 SHIFT Rnd 28.571 X 14 🗐 399.994

- Press (Norm) 1 to clear the Fix specifica-
- Example 2: 1 ÷ 3, displaying result with two significant digits (Sci 2)

w∞ 2 (Sci) 2 1 ₩ 3 ₩

Press (Norm) 1 to clear the Sci specification

Memory Calculations COMP

Use the we key to enter the COMP Mode when you want to perform a calculation using memory. COMP

Independent Memory

- · Values can be input directly into memory, added to memory, or subtracted from memory. Independent memory is convenient for calculating cumulative totals.
- · Independent memory uses the same memory area as
- To clear independent memory (M), input 0 SHET STO M
- · Example:

23 + 9 = 3223 5 9 SHIFT STO M (M+) 53 - 6 = 4753 **6** M+ -) 45 \times 2 = 90 45 X 2 SHIFT M-(Total) -11 RCL M (M+)

■ Variables

- . There are nine variables (A through F, M, X and Y), which can be used to store data, constants, results, and other
- Use the following operation to delete deat assigned to a particular variable:
 O Gent Sto A . This operation de-A . This operation deletes the data assigned to variable A.
- Perform the following key operation when you want to clear the values assigned to all of the variables. ET (McI)
- Example: 193.2 ÷ 23 = 8.4 $193.2 \div 28 = 6.9$

193.2 SEF STO A 🖶 23 🖼 △ A 😂 28 🖼

Scientific Function COMP **Calculations**

Use the key to enter the COMP Mode when you want to perform scientific function calculations.

Certain types of calculations may take a long time to

complete.

• Wait for the result to appear on the display before searting the next calculation.

• $\pi = 3.14159265359$

■ Trigonometric/Inverse Trigonometric **Functions**

To change the default angle unit (degrees, radians, grads), press the key a number of times until you reach the angle unit setup screen shown below.

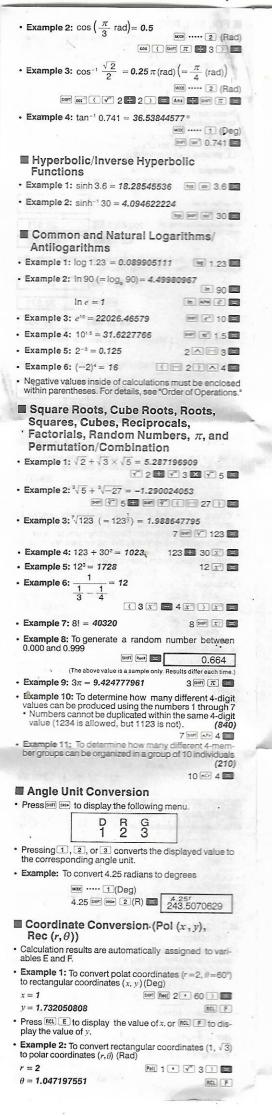

Deg Rad Gra

Press the number key (1, 2, or 3) that corresponds to the angle unit you want to use.

 $(90^{\circ} = \frac{\pi}{2} \text{radians} = 100 \text{ grads})$

Example 1: sin 63°52'41" = 0.897859012

Press ${\tt RCL}$ ${\tt E}$ to display the value of r , or ${\tt RCL}$ ${\tt F}$ to display the value of θ

■ Engineering Notation Calculations

 Example 1: To convert 56,08 	8 meters to kilometers
→ 56.088 ×10 ³	56088 EII (ENG
(km)	

· Example 2: To convert 0.08125 grams to milligrams → 81.25 × 10⁻³ 0.08125 ENG (ma)

Statistical **Calculations**

REG

Standard Deviation

SD

Use the em key to enter the SD Mode when you want to perform statistical calculations using standard de-SD

- In the SD Mode and REG Mode, the M+ key operates as
- the DT key.

 Always start data input with and CLR 1 (ScI) to clear
- statistical memory.

 Input data using the key sequence shown below. <x-data> DT
- Input data is used to calculate values for n, Σx, Σx², x̄, σ_n and σ_{n-1} , which you can recall using the key operations noted nearby.

To recall this type of value:	Perform this key operation:
Σx^2	SHIFT S-SUM 1
Σx	SHIFT S-SUM 2
n	SHIFT S-SUM 3
\bar{x}	SHIFT S-VAR 1
σ_n	SHIFT S-VAR 2
On-1	SHIFT S-VAR 3

 Example: To calculate σ_{n-1}, σ_n, x̄, n̄, Σx, and Σx² for the following data: 55, 54, 51, 55, 53, 53, 54, 52

In the SD Mode:

SET CLR 1 (Scl) (Stat clear)

55 pt n= SD

Each time you press [97] to register your input, the number of data input up to that point is indicated on the display (n value). 54 DT 51 DT 55 DT

53 DT DT 54 DT 52 DT Sample Standard Deviation $(\sigma_{n-1}) = 1.407885953$ SHIFT S-YAR 3 Population Standard Deviation (On) = 1.316956719 SHIFT S-VAR 2

Arithmetic Mean $(\bar{x}) = 53.375$

Number of Data (n) = 8Sum of Values $(\Sigma x) = 427$

Sum of Squares of Values $(\Sigma x^2) = 22805$

Regression Calculations

SHIFT S-SUM 1 REG

SHIFT S-VAR 1

SHIFT S-SUM 3

SHEFT S-SUM 2

Use the key to enter the REG Mode when you want to perform statistical calculations using regression REG

In the SD Mode and REG Mode, the M+ key operates as the DT key. Entering the REG Mode displays screens like the ones

 Press the number key (1, 2 or 3) that corresponds to the type of regression you want to use.

Linear regression
Logarithmic regression
Exponential regression
Power regression (Lin): (Log): (Exp): (Pwr): (Inv): Inverse regression (Quad): Quadratic regression

- Always start data input with per CLB 1 (Sci) to clear statistical menary.

 Input data using the key sequence shown below.

 <-data>! <y-data>!

 The values produced by a regression calculation depend
- on the values input, and results can be recalled using the key operations shown in the table below.

To recall this type of value:	Perform this key operation:
Σx^2	SHEFT S-SUM 1
Σχ	SHIFT S-SUM 2
n	SHIFT S-SUM 3
Σy^2	SHIFT S-SUM [1
Σy	SHIFT S-SUM 2
Σχγ	SHIFT S-SUM 3
X X	SHIFT S-VAR 1
Xσn	SHIFT S-VAR 2
XOn-1	SHIFT S-VAR 3
\bar{y}	SHIFT S-VAR 1
yσn	SHIFT S-VAR 2
yσ _{n-1}	SHIFT S-VAR 🕨 3
Regression coefficient A	SHIFT S-VAR 1
Regression coefficient B	SHIFT S-VAR D 2

Regression calculation other	r than quadratic regression
Correlation coefficient r \hat{x} \hat{y}	SHIFT S-VAR D D 3 SHIFT S-VAR D D D 1 SHIFT S-VAR D D D 2

The following table shows the key operations you should use to recall results in the case of quadratic regression.

To recall this type of value:	Perform this key operation:	
Σx^3	SHIFT S-SUM > 1	
$\Sigma x^2 y$	SHIFT S-SUM D 2	
Σx^4	SHIFT S-SUM 3	
Regression coefficient C	SHIFT S-VAR \blacktriangleright 🔁 3	
<i>\$</i> 1	SHIFT S-VAR D D 1	
£ 2	SHIFT S-VAR D D 2	
ŷ	SHIFT S-VAR D D 3	

The values in the above tables can be used inside of expressions the same way you use variables.

Linear Regression

- The regression formula for linear regression is:
 γ = A+Bx.
- · Example: Atmospheric Pressure vs. Temperature

	Temperature	Atmospheric Pressure
	10°C	1003 hPa
	15°C	1005 hPa
	20°C	1010 hPa
	25°C	1011 hPa
	30°C	1014 hPa

In the REG Mode:

Pressure vs. Temperature
Perform linear regression to determine the regression formula
terms and correlation coefficient
for the data nearby. Next, use
the regression formula to estimate atmospheric pressure at
-5°C and temperature at 1000
hPa. Finally, calculate the coefficient of determination (r²) and
sample covariance sample covariance

 $\sum xy - n \cdot \bar{x} \cdot \bar{y}$ n-1

1 (Lin) Stat clear) □ (Scl) □ (Stat clear)

10 1003 🖭 n= Each time you press (at the number of data input up to that point is indicated on the display (n value).

15 · 1005 DT 20 1010 PT 25 1011 PT 30 • 1014 PT

Regression Coefficient A = 997.4 SHIFT S-VAR P 1 SHIFT S-VAR D 2 Regression Coefficient B = 0.56 Correlation Coefficient r = 0.982607368 SHIFT S-VAR | | 3

Atmospheric Pressure at -5°C = 994.6 ((-) 5) SHIFT (S-VAR) 2 =

Temperature at 1000.hPa = 4.642857143

1000 SHIFT S-VAR | | | | | | | | 1 | |

Coefficient of Determination = 0.96551724 SHIFT S-WAR D 3 X2 = Sample Covariance = 35

(SHET S-SUM 3 = 3 X SHET S-VAR 1 X SHET S-VAR 1) (SHIFT S-SUM 3 = 1)

 Logarithmic, Exponential, Power, and Inverse Regression

 Use the same key operations as linear regression to recall results as the key operations as linear regression to re-call results for these types of regression.

The following shows the regression formulas for each

type of regression.

Logarithmic Regression	$y = A + B \cdot \ln x$
Exponential Regression	$y = A \cdot e^{B \cdot x} (\ln y = \ln A + Bx)$
Plower Regression	$y = A \cdot x^B (\ln y = \ln A + B \ln x)$
Inverse Regression	$y = A + B \cdot 1/x$

Quadratic Regression

 The regression formula for quadratic regression is: $y = A + Bx + Cx^2$

· Example:

	x_i	yi
[29	1.6
	50	23.5
	74	38.0
	103	46.4
	118	180

Perform quadratic regression to determine the regression formula terms for the data nearby. Next, use the regression formula to estimate the values for \hat{y} (estimated value of y) for $x_i = 16$ and \hat{x} (estimated value of x) for $y_i = 20$. for $v_i = 20$.

In the REG Mode:

▶ 3 (Quad) (Stat clear) (Sci) (Stat clear) (29) 1.6 (50) 1 23.5 (29 1.6 PD 50 20.5 74 38.0 T 103 46.4 T 118 48.0 T SHIFT S-VAR | 1 Regression Coefficient A = -35.59856934 SHIFT S-YAR D 2 Regression Coefficient B = 1.495939413 Regression Coefficient C = -6.71629667 × 10-3 SHIFT S.VAR | 3 | ŷ when xi is 16 = -13.38291067 16 SHIFT S-VAR D D 3 20 SHEFT S-VAR | | | | | | | 1 | | | 20 SHIFT S.VAR | | | | | | | 2 | | | \$2 when vi is 20 = 175.5872105
